Intro

The crime reporting system is created to help the society and the policemen in arresting criminals through reports against a crime. Which is sent by residents to the nearest police station, to start in its turn a response action against the criminal. This database was created to record the whole process from the resident's report till the criminal's arrest containing all the details.

Project Steps

1. Project context analysis.
2. Converting context into ER-diagram.
3. Converting ER-diagram into relational model diagram.
4. Creating a database.
5. Units-testing on database .

NOTE

All project files (requirements,ER,SQL queries,data guide) are available for download from the project's Github repository. Click [HERE](#) to access it.

Context Analysis

In this step we read the context of the project carefully, then we extracted 5 nouns and 6 verbs from it. That means 5 entities and 6 relations in the language of ER-diagram. Also, we extracted the attributes of each entity from the detailed requirements.

ER-Diagram

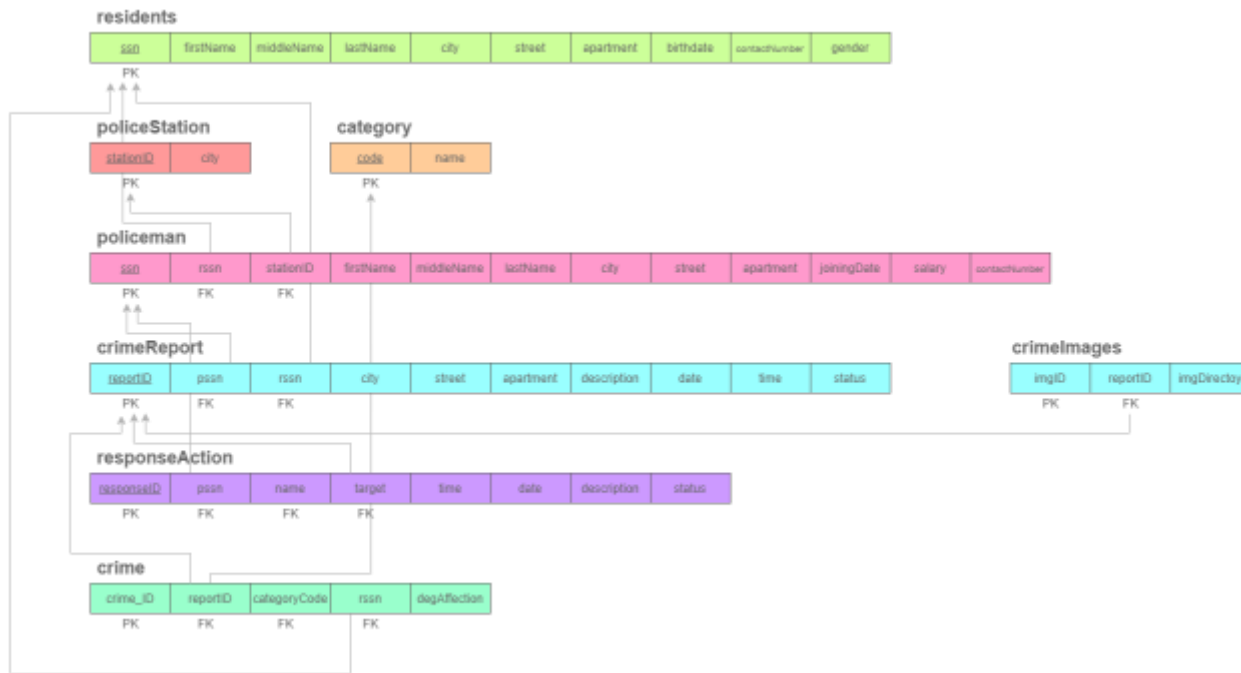

We converted the nouns and the verbs into 5 rectangles and 6 rhombuses and many ellipses. Each ellipse represents an attribute of an entity. Then we connected the attributes with their entities, and the entities with each other by relations to get a logical ER-Diagram. Which is the main rock for building databases.

- Residents report a crime through a crime report
- Each crime belongs to a category
- Each crime is directed by a police station
- The police station performs one or many response action(s)
- Response action(s) are done by policemen who serve in the police station

Relational Model

We converted the relations and entities of the ER-diagram into a relational model depending on the rules of this process. Then we determined the primary key and the foreign key of each. Also, we arranged them one by one from the top to bottom depending on the number of foreign keys at each table. This arrangement helps us create and insert data without errors.

Creating SQL database

We created two SQL files:

Database & Tables

In the first file we created the database and the tables depending on the relational model diagram. We added primary and foreign keys to each table.

```
CREATE DATABASE Crime_Reporting_System;

CREATE TABLE residents(
    ssn                char(10),
    firstName          varchar(20)          NOT NULL,
    middleName          varchar(20)          NOT NULL,
    lastName            varchar(20)          NOT NULL,
    city                varchar(25)          NOT NULL,
    street              varchar(25),
    apartment           int,
    birthdate           date,
    contactNumber        int                  NOT NULL,
    gender              char(1),
    PRIMARY KEY(ssn));

CREATE TABLE policeStation(
    stationID          char(3),
    city                varchar(25)          NOT NULL,
    PRIMARY KEY(stationID));

CREATE TABLE category(
    code                char(3),
    name                varchar(30)          NOT NULL,
    PRIMARY KEY(code));

CREATE TABLE policeman(
    ssn                char(9),
    rsn                char(10),
    stationID          char(3)              NOT NULL,
    firstName          varchar(20)          NOT NULL,
    middleName          varchar(20)          NOT NULL,
    lastName            varchar(20)          NOT NULL,
    city                varchar(25)          NOT NULL,
    street              varchar(25),
    apartment           int,
    joiningDate         date,
    salary              int,
    contactNumber        int                  NOT NULL,
    PRIMARY KEY (ssn));
```

```

CREATE TABLE crimeReport(
    reportID          char(10),
    pssn              char(9)                NOT NULL,
    rssn              char(10)              NOT NULL,
    city              varchar(25)           NOT NULL,
    street            varchar(25),
    apartment         int,
    description        varchar(max)         NOT NULL,
    date              date                  NOT NULL,
    time              time                  NOT NULL,
    status            varchar(max)          NOT NULL,
    PRIMARY KEY (reportID));

```

```

CREATE TABLE crimeImages(
    imageID           char(12),
    reportID          char(10)              NOT NULL,
    imgDirectory      varchar(max)          NOT NULL,
    PRIMARY KEY (imageID));

```

```

CREATE TABLE responseAction(
    responseID        char(8),
    pssn              char(9)                NOT NULL,
    name              varchar(40),
    time              time                  NOT NULL,
    date              date                  NOT NULL,
    description        varchar(max)         NOT NULL,
    target            char(10)              NOT NULL,
    status            varchar(max),
    PRIMARY KEY (responseID));

```

```

CREATE TABLE crime(
    crimeID           char(11)              NOT NULL,
    reportID          char(10)              NOT NULL,
    categoryCode      char(3)              NOT NULL,
    rssn              char(10)              NOT NULL,
    degAffection      varchar(max));

```

--Foreign Keys

```

('73365390483','7332006125','653','8610012865','companys data was exposed');
```

Unit-testing

In this step we checked if the database and tables were created. We also checked if the data was inserted correctly or not using “SELECT” queries.

Simple queries

Step 5.1) Insert a new Category having the following info: code is 314, name is Social Security Threat

```
INSERT INTO category (code,name)
VALUES ('314','Social Security Threat')
```

Step 5.2) Update the name of the policeman whose ssn is 312074327

```
UPDATE policeman
SET firstName='Ahmad',middleName='Yahya',lastName='Saleh'
WHERE ssn='312074327';
```

Step 5.3) List the names of residents in Beirut City

```
SELECT firstName,middleName,lastName
FROM residents
WHERE city='Beirut';
```

Step 5.4) List the name of policemen who joined after 1/1/2019 ordered alphabetically

```
SELECT firstName,middleName,lastName
FROM policeman
WHERE joiningDate >= '2019-01-01'
ORDER BY firstName,middleName ASC;
```

Step 5.5) List the ID and status of the crimes reported to the Policeman named “William Saliba”

```
SELECT DISTINCT reportID,status
FROM crimeReport,policeman
WHERE crimeReport.pssn=policeman.ssn AND policeman.firstName='William' AND
policeman.lastName='Saliba';
```

Step 5.6) List the number of pending crimes

```
SELECT COUNT(reportID)
FROM crimeReport
WHERE status ='Case under Investigation' OR status ='Investigation Pending Outcome';
```

Step 5.7) The ID of crimes that were reported to “Ghada Asaad” or had an action done by “Ghada Asaad”

```
SELECT reportID
FROM crimeReport,policeman,responseAction
WHERE crimeReport.pssn=policeman.ssn
AND crimeReport.pssn=responseAction.pssn
AND policeman.firstName='Ghada'
AND policeman.lastName='Asaad';
```

Step 5.8) The total number of crimes in each city

```
SELECT city,COUNT(reportID)
FROM crimeReport
GROUP BY city;
```

Step 5.9) The name of residents who have reported more than two crimes

```
SELECT firstName,lastName,COUNT(*)  
FROM residents,crimeReport  
WHERE residents.ssn=crimeReport.rssn  
GROUP BY firstName,lastName  
HAVING COUNT(*)>2;
```

Step 5.10) The number of responses for each crime witnessed today

```
SELECT COUNT(*)  
FROM responseAction  
GROUP BY date  
HAVING date='2021-01-06';
```

Step 5.11) The number of crimes in each category

```
SELECT name,COUNT(categoryCode)  
FROM category,crime  
WHERE category.code=crime.categoryCode  
GROUP BY categoryCode,name;
```

Step 5.12) The ID of crimes

```
SELECT reportID  
From crimeReport;
```

Complex queries

We used complex queries to extract useful information about residents, policemen, and crimes.

Complex Query 1 / Retrieve the ssn and names of residents who have not reported a crime.

```
SELECT      ssn,firstName, middleName, lastName
FROM residents
WHERE       NOT EXISTS
           (SELECT * FROM crimeReport WHERE SSN=RSSN)
```

Complex Query 2 / Names of residents who are policemen

```
SELECT firstName,lastname
FROM residents
INTERSECT
SELECT firstName,lastName
FROM policeman;
```

Complex Query 3 / Names of policemen who didn't make a response Action

```
SELECT firstName,lastName
FROM policeman
WHERE ssn IN (SELECT ssn
              FROM policeman
              EXCEPT
              SELECT pssn
              FROM responseAction);
```

Complex Query 4 / ID and Names of policemen who received a crime Report

```
SELECT DISTINCT ssn,firstName,lastName
FROM policeman
RIGHT JOIN crimeReport
ON policeman.ssn=crimeReport.pssn;
```

Complex Query 5 / ID, city and description of crimes reported on 2019-05

```
SELECT reportID,city,description
FROM crimeReport
WHERE date LIKE '2019-05-%'
UNION
SELECT reportID,city,description
FROM crimeReport
WHERE date LIKE '2020-05-%'
```

Features and Improvements that might be added

- API

We may create an API for statistical purposes

- GUI

Then we can link the API to graphical user interfaces (app, website).

- Extending

We can work on extending the database to cover more police stations.

- More Data

Data about police cars, residents' smart appliances that can be used in cyber crimes.
